

In the Abstract

The safety belt buckle, ~~comprising~~ includes interlocking receiving and inserted parts, the inserted part having the tongue including the opening at the tip of the tongue, ~~the said~~ The tip of the tongue is adapted to be received in the receiving part, ~~the~~ The receiving part is enclosed in the protective housing and comprising the U-shaped frame, ~~the~~ The front part of which the protective housing provides two symmetrically bent-inwards and facing each other portions of the flank walls of the frame, the [said] frame including the latch formed as a bent plate, ~~the said~~ The latch having has recesses in its side walls for supporting the blocking device, the front side of the ~~said~~ latch comprising the tooth is arranged to interact with the opening in the tongue and with the opening in the base of the frame, the back side of the said latch providing laterally symmetrical longitudinal projections freely arranged in the slots located in the side walls of the frame, ~~the~~ The blocking device for blocking the latch, ~~the said blocking device~~ is moveable within oblong apertures in the direction parallel both to itself and the base of the frame, the release button with side walls having slots for capturing the blocking device, ~~the~~ The pusher with pushing spring ~~interacting~~ interacts with the tongue of the buckle, the spring of the blocking device being arranged to act on the ~~said~~ blocking device, ~~and the~~ There are anchoring elements for securing the buckle to the body of a motor vehicle. The latch comprises additionally two supports for the blocking device, the ~~said~~ supports are being so arranged by one of the sides of recesses of the latch that the supports for the blocking device and the front edge of recesses of side walls of the latch define a gap in between them, and the height of the supports for the blocking device in the side walls of the latch is equal to or exceeds the value of the depth of the recesses at the said side walls of the latch, and the blocking device supports make an acute angle with a longitudinal axis of the latch.
